Introduction and motivation

- **Distributed embedded application** as a single system to be designed
- Start from an abstract **Model-Based System** Specification
- Modeling and Analysis of Real-Time and Embedded Systems (MARTE) profile for the unified modeling language (UML)
- **Refinement steps** and simulations
Background and open issues

• Design of the network infrastructure starting from a library of nodes and channels (Network synthesis)
  – Communication Aware Specification and Synthesis Environment (CASSE), [FDL 2010]

• Open issue: *We need a standard representation of requirements (from the initial user specification) and solutions*
Main idea of this design flow

Design methodology for networked embedded systems which combines UML/MARTE, network synthesis, and simulation.

UML/MARTE not only at the starting point but also at the center of design flow as repository of refined version of the system up to the final solution.
Proposed methodology

SystemC Network Simulation Library (SCNSL)

Modeling requirements
- Description of actual nodes & channels
- Environment description

Application requirements
- Tasks & Data flows
- Throughput & Latency requirements
- Communication & computation requirements
- Environment constraints
- Description of actual nodes and channels
- Nodes & channels allocation
- Network statistics: packet loss rate, delay

CASSE

Network View Simulation
- Network synthesis
- Task implementation

System View Simulation
Modeling requirements

• The main entities to be represented in UML/MARTE are:
  – Tasks, data flows, nodes, channels and the external environment
Entities

- **Task**: basic function; it can have either digital input or digital output as well as both
- **Data flow**: unidirectional sequence of digital data between two tasks
- **Node**: networked embedded system hosting one or more tasks
- **Abstract channel**: abstraction of a channel hosting one or more data flows; two or more nodes can be connected to the same abstract channel
- **Zone**: piece of the external environment in which one or more nodes are deployed
- **Contiguity**: distance between zones
Abstract channel

**Definition:** Level-N Abstract Channel

Referring to the ISO/OSI model and assuming that the functionality to be designed is at level N, the AC contains the physical channel, and all the protocol entities up to level N - 1.
Abstract channel (2)

• A level-N abstract channel with N>2 may contain intermediate systems
  – They are not considered as nodes in the network synthesis
  – But they are taken into account during the design of the abstract channel
Zones and contiguity

• Many distributed embedded applications interact with the physical environment for data sampling and/or actuation
• Network infrastructure is constrained by the physical environment
  – Length of cables
  – Propagation of wireless signals
• The physical environment is modeled as a set of one or more Zones
• The distance between Zones is modeled by using Contiguity entity
Example

<table>
<thead>
<tr>
<th>Node</th>
<th>Type</th>
<th>Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>n_{1-5}</td>
<td>A</td>
<td>t_4, t_5</td>
</tr>
<tr>
<td>n_{6-13}</td>
<td>D</td>
<td>t_3</td>
</tr>
<tr>
<td>n_{14}</td>
<td>B</td>
<td>t_1, t_2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Abstract Channel</th>
<th>Type</th>
<th>Nodes</th>
</tr>
</thead>
<tbody>
<tr>
<td>a_1</td>
<td>Z</td>
<td>n_1, n_{6-8}</td>
</tr>
<tr>
<td>a_2</td>
<td>Z</td>
<td>n_2, n_9</td>
</tr>
<tr>
<td>a_3</td>
<td>Z</td>
<td>n_3, n_{10}, n_{11}</td>
</tr>
<tr>
<td>a_4</td>
<td>Z</td>
<td>n_4, n_{12}</td>
</tr>
<tr>

<td>Z</td>
<td>n_5, n_{13}</td>
</tr>
<tr>
<td>a_6</td>
<td>X</td>
<td>n_{1-5}, n_{14}</td>
</tr>
</tbody>
</table>
Goal of this flow

• The described flow allows to perform Network Synthesis = define the application in terms of
  – Tasks on nodes
  – Dataflows on abstract channels
  – Nodes on zones
Modeling entities in UML/MARTE

• Entities are modeled as classes inside UML/MARTE
  – Definition of their attributes

• Generic Quantitative Analysis Modeling (GQAM) sub-profile of MARTE profile is used to specify the semantics of some classes and their attributes
Class diagram of the entities

Zone
- e: Env_Condition [1]
- s: LengthUnitKind [1]
- n: Node [1..*]

Contiguity
- z1: Zone [1]
- z2: Zone [1]
- d: LengthUnitKind [1]

«gaCommHost, gaCommChannel»
CommunicationAttr
- max_throughput: NFP_Frequency [1]
- max_delay: NFP_Duration [1]
- max_error_rate: NFP_Frequency [1]

«gaExecHost»
throughput = [CommunicationAttr::max_throughput]
blockT = [CommunicationAttr::max_delay]

Node
- c: ComputationAttr [1]
- gamma: NFP_Real [2]
- k: NFP_Price [1]
- m: NFP_Boolean [1]
- p: NFP_Power [1]
- t: Task [1..*]

Task
- c: ComputationAttr [1]
- m: NFP_Boolean [1]

DataFlow
- ts: Task [1]
- td: Task [1]
- c: CommunicationAttr [1]

«gaCommChannel»
CommunicationAttr
- mem_size: NFP_DataSize [1]
- CPU: NFP_Real [1]
Extension of the entities

- Some entities need to be specialised for modeling actual applications
  - Task, dataflow, node and abstract channel
  - Attributes get values which are constant for all the instances of the specialized class
Extension of the entities (2)

- **Task**
  - Can be specialised into: sensor, actuator, controller, etc.

- **DataFlow**
  - Specific dataflows between subclasses of Task

- **Node**
  - Nodes taken from a datasheet

- **Abstract channel**
  - Well-known channels and protocols
Requirements vs. availability

• Tasks and Nodes as well as Data Flows and Abstract Channels have similar attributes with different meaning
  – Requirements for Task and Data Flows
  – Available resources for Nodes and Abstract Channels

• Example: throughput
  – Max throughput generated by the Data Flow
  – Max throughput supported by the Abstract Channel
Distance in Abstract Channel and in Contiguity

• In Abstract Channels $d$ attribute represents the communication range provided by it
• In Contiguity $d$ attribute represents the distance between the corresponding zones
• When an Abstract Channel crosses two or more zones the communication range must be higher than the distance between zones
Example: Contiguity affects Abstract Channel choice

Even if data flows between T1 and T2 are the same, C1 and C2 cannot be the same since C1 does not cross Zones while C2 must cross Zones with Contiguity=5
Implicit constraints and application-level constraints

- Implicit constraints are given by the semantics of nodes, tasks, channels, zones
  - They are always present and therefore they don’t need to be modeled in UML/MARTE

- Application-level constraints come from the customer

- Both of them will be put into the optimization problem of network synthesis
Examples of implicit constraints

- The memory available in a node must be greater than the sum of memory required by the hosted tasks.
- The max delay provided by a channel must be lower than the max delay permitted by each of the hosted data flows.
- The distance between two zones (attribute of contiguity) must be lower than the distance provided by all the channels crossing such zones.
Modeling application-level constraints

- Example of constraint: “maximum one instance of task t3 can be assigned to each node”
- Application constraints are specified by using cardinality on the relationships between objects
Application requirements

Task implementation

System View Simulation
System View simulation

- A sc_module class for Task entity is provided
  - It must be specialized for application-specific tasks

- Task instances are created and connected through TLM sockets representing data flows
System view simulation

- UML/MARTE class diagram is extracted and used to generate SystemC/TLM model
  - Other ways to generate executable models in [Villar 2009] and [Vanderperren 2008]
- Execution of the SystemC model
  - Validate the functional behavior of the application
  - Fine-tune implementation details such as the content of exchanged messages and their sending rates
- Back annotation of throughput, latency and max error rate inside UML/MARTE model

Network synthesis

CASSE
Network synthesis

- All the information about user constraints, communication requirements and actual channels and nodes are extracted from the UML/MARTE model and translated into Network synthesis mathematical representation.
- CASSE provides a mathematical notation to specify the network dimension of a distributed embedded system.

Dataflow(f4) = [t3, t4, [3, 1, 0.3]]
Network synthesis cont’d

Set of tasks & data flows

- **t3 : Task**
  - c = 1.1
  - m = true

- **t4 : DataFlow**
  - ts = t3
  - td = t4
  - c = 3.1, 0.3

The building geometry

- **z3 : Zone**

Technological library

- **b : Node**
  - c = 10, 10
  - gamma = [0.6, 0.9]
  - m = false
  - k = 100

- **y : AbstractChannel**
  - c = 54, 2, 0.1
  - d = 30
  - w = true
  - k = 20

SystemC /TLM
Network view simulation

- SCNSL is an extension of SystemC to allow modeling packet-based networks
  - It allows the easy and complete modeling of distributed applications of networked embedded systems such as wireless sensor networks, routers, and distributed plant controllers
### Correspondence between UML/MARTE and SCNSL elements

Design the network before designing nodes and channels

• The shown flow allows to define the application in terms of
  – Tasks on nodes
  – Dataflows on abstract channels
  – Nodes on zones

• The network organisation is designed before nodes and channels
Design the network before designing nodes and channels

- At the end of this flow nodes and channels can be considered in an actual way
  - Nodes are either taken from the market or designed with traditional techniques for embedded systems
  - Channels are created by assembling
    - Physical channels: wired, wireless
    - Protocols
    - Intermediate systems: switch, router
Case study: temperature control application of a skyscraper

- In each room, there is at least one sensor $S$ which keeps track of the local temperature. Collected data are sent to controllers $C$, which send commands to actuators $A$, e.g., coolers.
- Controllers can be either fixed (e.g., on the wall of each room) or embedded into mobile devices to let people set the preferred temperature of the environment around them.
- A centralized controller is also present to perform some global operations on the temperature control system, e.g., to ensure that room settings comply with the total energy budget.
Case study

- one instance of actuator should be placed in each zone
- max......

Conclusions

• Some UML/MARTE diagrams and stereotypes have been used to represent the building blocks of a distributed embedded application
  – Class diagram, GQAM and deployment diagrams

• SystemC code has been generated for both functional and network-aware simulation

A MARTE-centric flow for network synthesis
